

CO₂e emissions from transport with GLS

Calculation for I.E.S.E.

Period January 22- December 22

Transport		
Destination	Parcels/ freight units	Well-to-wheel emissions (kg CO ₂ e)
Domestic (ES)	1.044	1.033,18
Export	19	60,15
Total	1.063	1.093,33

Business activities		
	Parcels/ freight units	Scope 1,2 & 3 emissions (kg CO ₂ e)*
	1.063	43,32

Explanations

The calculation of transport emissions is certified according to EN 16258.

The underlying data for the calculation of emissions resulting from our business activities is taken from the annual internal life cycle assessment, which is prepared for the entire GLS Group. The procedure for preparing the life cycle assessment is based on DIN EN ISO 14064-1.

GLS calculates all emissions as CO₂ equivalents (CO₂e). As a result, greenhouse gas emissions other than CO₂ are included.

The calculation considers the well-to-wheel CO₂e emissions. Therefore all the emissions from fuel generation to the combustion in the vehicles are considered.

Please see our company website for further information:

<https://gls-group.eu/GROUP/en/our-responsibility>

*Including all emissions from administrative and operational processes
